Csl protein is localised to the nucleus and has 86% homology CC to the mouse Csl. Structural homology between Csl and scallop regulatory myosin light chain is also detected. It is predominantly expressed in CC heart and skeletal muscles and is activated after the differentiation of CC cells. Csl functions in regulation aspects of differentiation or CC dataptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic CC treatment of diseases such as those involving aberrant muscle cell CC development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchenne CC muscular and myotonic dystrophies, skeletal myopathies such as Duchenne CC muscular dystrophy, myocarditis, myofiber atrophy, heart failure, CC cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene CC sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                         myopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of heart diseases. The present sequence is 66214 protein encoded by an expressed sequence tag (EST) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a subject at risk for a heart disease e.g. congestive heart failure, dilative cardiomyopathy, heart muscle disease, by quantifying the polypeptide expressed by genes abnormally expressed in heart tissue
                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1a; Fig 9c; 154pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 श
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the murine chisel protein (Csl), that is a common control of the EF-Hand protein super family and is involved in signalling pathways. Csl protein is localised to the nucleus and does not show significant homology to any known protein. Structural homology between Csl and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle conditions in regulation aspects of differentiation or adaptive processes that maintain muscle chamostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those convolving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular dystrophy and Becker's skeletal myopathies such as Duchenne muscular dystrophy, myocarditis, myofiber atrophy, heart failure, cardiac hypertrophy, myocarditis, cmyofiber atrophy, etc. The Csl gene sequence can also be used in gene to the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the xenopus chisel protein (Cs1), that is a C member of the EF-Hand protein super family and is involved in signalling pathways. Csl protein is localised to the nucleus and does not show cs significant homology to any known protein. Structural homology between CC sl and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle con be monestasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those cc prophylactic and therapeutic treatment of diseases such as those cc involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, cs keletal myopathies such as Duchenne muscular dystrophy, and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, cm myofiber atrophy, etc. The Csl gene sequence can also be used in gene creative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel human secreted polypeptides. The polypeptides are useful for polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, teeting and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoissis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

CC (ANYELIA 1-85) and polymucleotides (AAX82076-90) encoding the proteins.

CC (ANYEL841-855) and polymucleotides (AAX82076-90) encoding the proteins.

CC produce the SIGP protein. The SIGP protein can be used, in conjuncture

CC with a pharmaceutical carrier to treat or prevent a cancer. An antagonist

CC immune response. The cancers that can be treated or prevented include

CS sarcomas, adenocarcinomas, leukemia's, lymphomas, melanomas,

CC bone, bone marrow, brain, breast, cervix, gall bladder, ganglia,

CC gastrointestinal tract, heart, kidney, liver, lung, muscle, ovary,

CC pancreas, parathyroid, penis, prostate, salivary glands, skin, spleen,

CC testis, thymus, thyroid, and uterus. The immune responses that can be

CC treated or prevented include, AIDS, Addison's disease, adult respiratory

CC distress syndrome, allergies, anemia, asthma, atherosclerosis,

CC dermatitis, dematomyositis, Crohn's disease, ulcerative colitis, atopic

CC dermatitis, dematomyositis, diabetes mellitus, emphysema, atropic

CC gastritis, glomerulonephritis, Grave's disease, gout, hypereosinophilia,

CC myasthenia gravis, myocardial or pericardial inflammation,

CC osteoarthritis, osteoporosis, pancreatitis, polymyositis, rheumatoid

CC complications of cancer, infections, and trauma.

The CC method comprises applying the mechanical stress to an organism (tissue CC or cells comprises) bone cells), isolating the specific cellular CC fractions and extracting mRNA from them, and differentially analysing the CC mRNA in comparison with control samples. The method is used to identify genes whose expression is responsive to a specific stress. The identified CC genes are employed in determining risk associated with a physiological or CC disease state. The risk determination methods are used for testing a CC the method of the invention, are used for treating or controlling a physiological or disease state a physiological or disease state of the invention, are used for treating, preventing or controlling a physiological or disease state (especially osteoporosis or CC bone density or other factors causing or contributing to osteoporosis or its symptoms or other conditions involved in mechanical stress or its symptoms or other conditions involved in mechanical stress or its bone devalonment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

Protein 608 was identified using the method of the invention after subjecting rat osteoblasts to mechanical stress. Expression of the 608 gene was found to be upregulated by about 3-fold in cells subjected to mechanical strain. The specification describes a method for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polyperide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags (CC for identifying expressed genes. (I) is useful in gene therapy techniques (CC to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques (CC quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. (CC The polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations (CC and to produce other types of data and products dependent on DNA and CC and to produce other types of data and products dependent on DNA and CC and sequences. AEGO0010-AEG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC ONCE: The sequence data for this patent did not appear in the printed CC at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                , B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autism) cardiovascular disorders (e.g. atherosclerosis and myocarditis), autoimmune disorders (e.g. rheumatoid arthritis, multiple sclerosis, ankylosing spondylitis, Addison's disease, Sjogren's syndrome, vitiligo, asthma, atopic dermatitis and diabetes mellitus), inflammatory disorders (e.g. pancreatitis, sarcoidosis and allogenic transplant rejection) and cancers and neoplasms (e.g. leukaemia, Burkitt's lymphoma and multiple myeloma). The presence or absence of a mutation in the nucleic acid encoding the protein allows for diagnosis of or susceptibility to a pathological condition. The sequences are also useful in screening for agonists and antagonists of PTPase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a human protein tyrosine phosphatase (PTPase) polypeptide. PTPase proteins and nucleic acids are useful for preventing, treating or ameliorating a medical condition. The medical conditions are disorders of the central and peripheral nervous system (e.g. Alzheimer's disease, Huntington's disease, Parkinson's disease, Tourette's syndrome, because the protein of the central and peripheral nervous system (e.g. Alzheimer's disease, Tourette's syndrome, disease, Tourette's syndrome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human protein tyrosine phosphatase polypeptide useful for treatment of disorders including disorder of the nervous system - \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   obsessive compulsive disorder,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel genes (AAI99614-AAI99654) and proteins (ABB03062-ABB03085) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's allergies, autoimmune and allergies mellitus, Crohn's allergies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. cancer), (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketconuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polymucleotides of the invention can also be used in gene therapy.

AAUZ2915-AAUZ3814 represent the novel human enzyme polypeptides of the

HD-PTP proteins, nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel human tyrosine phosphatase, histidine domain-protein tyrosine phosphatase (HD-PTP, AAB39661) and to human HD-PTP nucleic acids (AAC81224, AAC8125, AAC81262). The HD-PTP gene is located on chromosome 3p21.3. This region is frequently found to be deleted in lung cancers, and is therefore thought to contain a tumour suppressor gene. The invention also relates to expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and antibodies may be used in the treatment, investigation and diagnosis of cancers, particularly those of the lung. The present sequence represents a human HD-PTP fragment encoded by the CKAL16 cDNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human tyrosine phosphatase with oncostatic activity encoded by a gene frequently deleted in lung cancer, useful for treatment and diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel human tyrosine phosphatase, histidine domain-protein tyrosine phosphatase (HD-PTP; AAB29661) and to human CC HD-PTP nucleic acids (AAC81224, AAC81225, AAC81262, AAC81263). The CC HD-PTP gene is located on chromosome Jp21.3. This region is frequently found to be deleted in lung cancers, and is therefore thought to contain CC a tumour suppressor gene. The invention also relates to expression CC vectors and host cells containing human HD-PTP nucleic acids; the CC reagents production of HD-PTP, anticancer drugs containing HD-PTP; Greater therefore the production of HD-PTP anticancer drugs containing HD-PTP; Greater containing HD-PTP oligonucleotides; antibodies specific for CC use in cancer diagnosis and investigation. HD-PTP proteins, nucleic acids of cancers, particularly those of the lung. The present sequence represents a human HD-PTP fragment encoded by the CKALII DNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

These substances are used to treat pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; gene therapy (optionally after mutation). Ab are used to determine the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents human ALF. The above proteins, other than ALK-7, are protein tyrosine phospharases (PTPs) and are accounted to the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 2; Page 160-164; 193pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding specific protein tyrosine phosphatases useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 1999-009434/01.

The invention relates to a novel human tyrosine phosphatase, histidine CC domain-protein tyrosine phosphatase (HD-PTP, ABR2661) and to human CC HD-PTP nucleic acids (AAC81224, AAC81225, AAC81262, AAC81263). The CC HD-PTP gene is located on chromosome 3p21.3. This region is frequently CC found to be deleted in lung cancers, and is therefore thought to contain CC atumour suppressor gene. The invention also relates to expression CC vectors and host cells containing human HD-PTP nucleic acids; the CC recombinant production of HD-PTP; anticancer drugs containing HD-PTP; gene therapy compositions containing DNA encoding HD-PTP; diagnostic CC reagents containing HD-PTP oligonucleotides; antibodies specific for CC Use in cancer diagnosis and investigation. HD-PTP proteins, nucleic acids and antibodies may be used in the treatment, investigation and diagnosis CC represents a substantial portion of the human HD-PTP protein.

Structural polyprotein (P130) [Contains: Coat protein C (EC 3.4.21.-)
(Capsid protein C); Spike glycoprotein E3; Spike glycoprotein E2;
6 kDa peptide; Spike glycoprotein E1].
Eastern equine encephalitis virus (strain va33[ten broeck]) (Bastern
                                                                                                                                                                                                                                                                                                                                                                                                                    VIROLOGY 182:774-784 (1991).

-i- FUNCTION: THE CAPSID PROTEIN IS AN AUTO-PROTEASE.

-i- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE.

-i- MISCELLANEOUS: THE 6 LDA POLYBEPTIDE PROBABLY SERVES AS SEQUENCE FOR THE MEMBRANE GLYCOPROTEIN E1, WHICH IS THE HEMAGGLUTININ.
